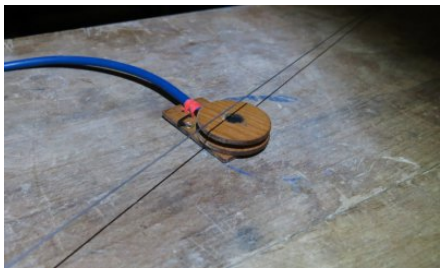
Infra PickUp



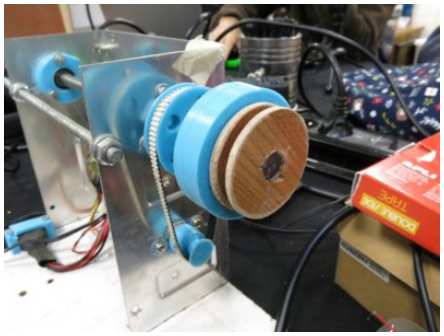
Profiter de ces beaux jours d'automne pour se chauffer au néons et ressortir la petite bobineuse pour créer un mirco

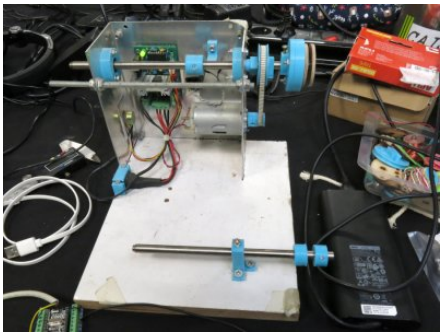
la base infrastructurelle

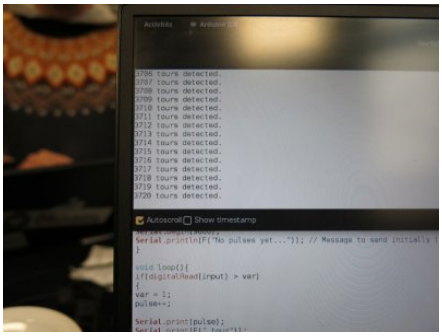
- Deux disques de cp plaqué de 3 mm découper à la scie cloche
- Un aimant Alnico de 10mm de diamètre
- Du fil enamel de 0,063mm de diamètre
- Une plaque rectangulaire pour insérer les œillets et fixer le câbles audio

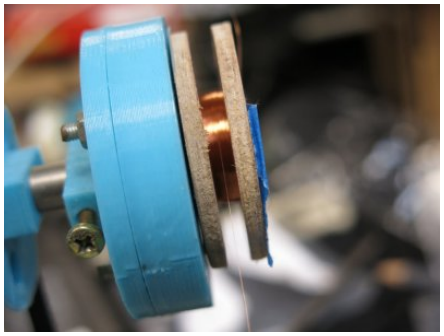
le bobinage

- Un petit programme arduino pour compter les tour de bobines (grâce à un aimant placer sur l'axe de rotation et interrupteur reed)
    - récupérer ici : https://forum.arduino.cc/t/simple-pulse-counter/519930
- Environs 3500 tours



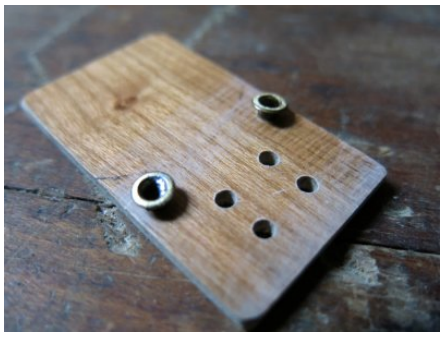






assemblage

- La bobine et la base sont collés à l'epoxy

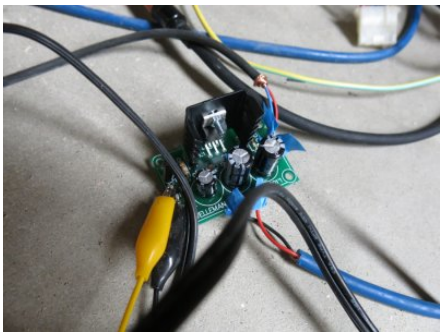


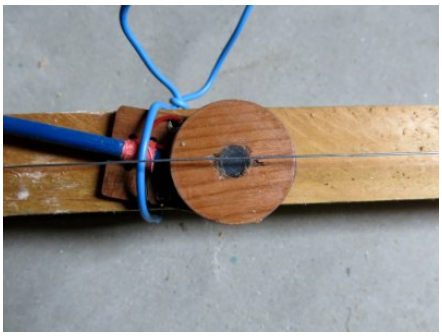
trempage

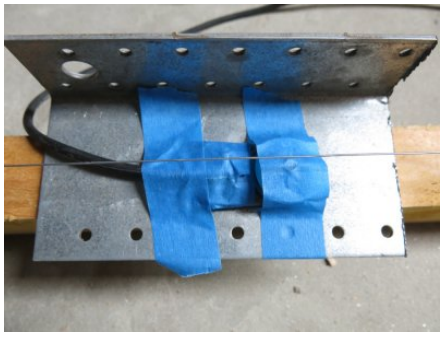
- Pour donner à l'ensemble un peu d'homogénéité et surtout protéger la bobine le tout est laisser trempé dans de la paraffine jusqu'à temps qu'il n'y ai plus de petites bulles

essai infrabassique avec retour d'informations

- Ça fonctionne plutôt bien au niveau des infras
- Ajout d'un second micro (caché sous le scotch bleu)
- Câblage du gros micro et du petit avec un ampli mono 7W pour créer un feedback de résonnances







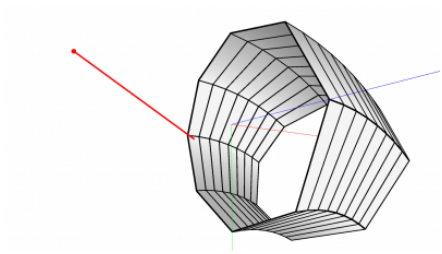
Infra graphique

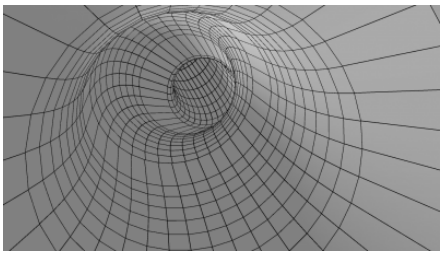
Dérive dans les images semi-graphiques. Avant le graphisme «hi-res». Journal : infra-graphique

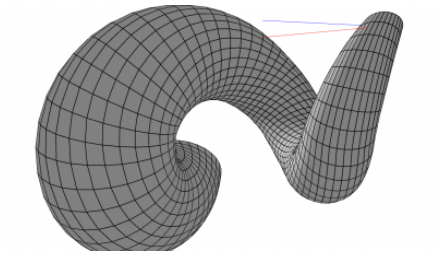
Quaternion

Exploration des quaternions et de la modélisation procedurale avec Processing

Une vidéo qui m'a bien aidée à comprendre le ce truc : https://www.youtube.com/watch?v=bKd2lPjl92c







Les sketchs Processing ci-dessous dépendent de façon importante sur deux librairies non officielles:

- **QueasyCam** (modifié), pour la navigation dans l'espace en 3D → https://github.com/gweltou/queasycam/tree/master/distribution/queasycam-6/download/
- **LibAvatar**, pour l'intégration des classes de LibGDX dans Processing → https://github.com/gweltou/Processing-libAvatar/blob/2.0/distribution/libAvatar-3/download/libAvatar.zip

Vous pouvez naviguer dans l'espace 3D avec les touches ZQSDA et E. Affichage en mode filaire avec W.
